The following opcodes are used for addition:

- ADDI Add Signed Integer
- ADDU Add Unsigned Integer
- ADDF Add Floating Point

ADDI — Add Signed Integer {#ADDI}

```
L2 = L2 + <signed_imm>
L2 = L2 + <reg_val>
L2 = L2 + <const>
```

=== "ADDI Example"

```
'``linenums="1" hl_lines="1 3 5 7"
; imm +ve
   ADDI   1
; imm -ve
   ADDI   -123
; reg val
   ADDI   val(QT)
; const
   ADDI   SOME_CONST_VAL
```

=== "ADDI Properties"

ADDU — Add Unsigned Integer {#ADDU}

```
L3 = L3 + <unsigned_imm>
L3 = L3 + <reg_val>
L3 = L3 + <const>
```

=== "ADDU Example"

```
```linenums="1" hl_lines="1 3 5"
; imm +ve
 ADDU 1
; reg val
 ADDU val(QT)
; const
 ADDU SOME_CONST_VAL
```

## === "ADDU Properties"

```
| Opcode | Operand Type | Destination | |------| | 18 | Unsigned 64-bit integer | L3 (implicit) | | Identified as memonic [#18](#ADDU), ADDU is used to add a 64-bit unsigned value to the L3 register
```

## ADDF — *Add Float value* {#ADDF}

```
L1 = L1 + <float>
L1 = L1 + <reg_val>
L1 = L1 + <const>
```

### === "ADDF Example"

```
'``linenums="1" hl_lines="1 3 5"
; imm float
 ADDF 3.14
; reg val
 ADDF val(QT)
; const
 ADDF SOME_CONST_VAL
```

### === "ADDF Properties"

```
| Opcode | Operand Type | Destination |
|-----|
| 23 | 64-bit Float Value | L1 (implicit) |
```

Identified as memonic [#23](#ADDF), ADDF is used to add a 64-bit floating point value to the L1 register
